

PRO Range

BRASS BALL VALVES WITH ISO 5211 CONNECTION

USE

- systems using alternative energy
- automation systems
- glycol cooling systems
- heating/cooling systems
- open and closed hydraulic systems
- industrial systems using hot and cold fluids
- water treatment systems
- compressed air systems

FUNCTIONS

The 2-way and 3-way ball valves, in combination with the suitable actuator of the **PRO** range, are used to intercept, divert, regulate and mix fluids.

TECHNICAL FEATURES • The ball valves comply with Ministerial Decree 174

BRASS BALL VALVES ISO 5211 connection FULL BORE

PN [bar] DIAGRAM PN = f(T)

When the value of the flow is known, the general expression for the calculation of pressure losses is the following:

$$\Delta p [\text{bar}] = \left[\frac{Q [\text{m}^3/\text{h}]}{k_v} \right]^2$$

The expression provided applies to water or technically similar fluids.

FLUIDS Water and EPDM & PTFE-compatible fluids • Other fluids on request

TEMPERATURES

	Valve	Valve with spacer
• Minimum	-10°C	-20°C
• Maximum	+110°C	see below

- a** • 2-way ball valve with ISO 5211 connection and spacer: Peak T * = 160°C
- b** • 3-way ball valve with ISO 5211 connection and spacer: Peak T * = 160°C
- c** • diverter/mixer ball valve with ISO 5211 connection and spacer: Peak T * = 120°C

* Maximum temperature that can be reached for a short period of time

2-WAY BALL VALVE

The ball valve can be mounted in both flow directions, without distinction.

3-WAY DIVERTER / MIXER BALL VALVE

MIXING/DIVERTING BALL VALVE (3-HOLE BALL)

The **MIXING/DIVERTING** ball valve has a 3-hole ball with one hole pointed towards the common way C (always open) and two more holes which are orthogonal to the first one and to each other. When one of these two holes is pointed towards one of the two inlets, for example A, the second inlet B is closed.

When the operation is completed, with a rotation of the ball of 90°, the second hole is oriented on the second way (B), closing the first one (A). A characteristic of the 3-hole ball valve is that it closes one way, while the other one starts opening: for a short while, during the operating phase, all the three ways are communicating. Moreover, the above mentioned condition allows this valve to be used for mixing.

DIVERTER / MIXER - 3 HOLES - C = COMMON WAY

P20 Range

BRASS BALL VALVES WITH ISO 5211 CONNECTION

DIVERTER BALL VALVE (2-HOLE BALL)

The ball has 2 holes: the first hole is always oriented toward the common way (C), the second hole can be oriented toward either the A or B way, with a rotation of 180°. The **DIVERTING** ball valve closes one of the two inlets before the other one opens, therefore the two ways never communicate. On the control rod there is symbol, which indicates which way is communicating with the common one (C).

3-WAY DIVERTER BALL VALVES

In **Diamant P20 ISO** valves, the horizontal 3-way version is available with a T-ball or L-ball; in both cases, they are used to allow a deviation. Both ball valves close one way and, at the same time, start opening of the other one: for a short period of time, during the operating phase, all three ways are in communication with each other. Despite the condition described above, however, it is not possible to carry out a mixing adjustment by means of this type of valve because of the limited dimensions of the sections created.

DIVERTER BALL VALVE • “T” BALL

The T-ball diverter ball valve features a ball that can be used in different ways depending on the initial orientation. As can be seen in the picture, with a 90° rotation it is possible to create different configurations. The position of the holes is indicated by a T engraved on the ball valve pin.

DIVERTER BALL VALVE • “L” BALL

The diverter ball valve with L-shaped ball has a common central way C and two ways which are put into communication with it when they make a 90° rotation. The position of the holes is indicated by an L engraved on the ball valve pin.
